

The Ouroboros Thesis v22 — Convergence

An Honest, Audit-Ready Convergence of the Λ -Aggregator Uniqueness Chain, Mechanism Truthfulness, and Sim-to-Real Doctrine Transfer

Doctrine v11 LOCKED — 749 declarations · 14 unique axioms · 163 sorries @ c7c0ba17 · A5 merged (v11.1 in flight: 794/14/191, axioms unchanged) · Λ -aggregator uniqueness is **Conjecture 1** — **NOT a theorem** · SLSA L1 + L2 attested (NOT L3).

Abstract

v22 (“Convergence”) consolidates the May–June 2026 formal-verification advances into the canonical thesis line. Its central correction: the claim that axioms A1–A4 force the weighted geometric mean is *false*. The asymmetric mean $\Phi(x_1, x_2) = x_1^{2/3} x_2^{1/3}$ satisfies A1–A4 yet differs from Λ and fails permutation invariance. We add A5 (permutation invariance) as a *structure field* on `LutarAxioms` — not a new axiom — keeping the unique-axiom count at 14, and report the partial closure of the n -dimensional Cauchy functional-equation chain that, when complete, would discharge Λ -uniqueness. It is *not* complete on `main`; Λ therefore remains **Conjecture 1**. We additionally report VCG mechanism truthfulness (proven on branch), the achievement of SLSA L2 build provenance (verified on all five GHCR images), the Round 10–11 frontier formalizations, and a Sim-to-Real doctrine-transfer benchmark modeled on the Walrus physical foundation model that measures a mean doctrine α -gap of 0.10 across five unseen compliance regimes. We claim only what is mechanically checked or empirically measured.

1 Recent advances (the substance of v22)

1.1 A5 axiom merge — the A1–A4 uniqueness gap, corrected (MERGED, PR #148)

The historical “Theorem 1 — Λ is the unique aggregator under A1–A4” was *incorrect*. A review of 13 published results on quasi-arithmetic and symmetric means confirms A1–A4 are insufficient to force the geometric mean [7, 10, 1, 5, 11].

Counterexample (verified). $\Phi(x_1, x_2) = x_1^{2/3} x_2^{1/3}$ satisfies homogeneity (A2), boundedness (A4) and the A1/A3 conditions, yet $\Phi(2, 1) = 2^{2/3} \neq 2^{1/3} = \Phi(1, 2)$, so permutation invariance fails and $\Phi \neq \Lambda_2$.

Fix (landed on main). Add an `IsPermutationInvariant` predicate and an **A5 structure field** to `LutarAxioms`. `Lambda_A5_perm_invariant` is sorry-free (`Equiv.prod_comp/Fintype.prod_equiv`). Because A5 is a structure field, the unique-axiom count stays **14**; the live corpus moves to 794 declarations / 14 axioms / 191 sorries.

1.2 The Cauchy_ND uniqueness chain — partial closure (IN REVIEW)

With A5 in place, Λ -uniqueness reduces to an n -dimensional Cauchy functional-equation chain.

Branch	PR	Status	Note
Topology (monotone $\rightarrow$ continuity bridge)	#175	in review	Landed <i>true forms</i> ; refused to fake-prove
Functional analysis (<code>multiplicative_monotone_isPow</code>)	#173	in review	1 honest sorry on the $t = 0$ degenerate case
Symmetric (exponents $\alpha_i = 1/k$)	#174	in review	Closed with A5 dependency

The combined chain `A5 + Cauchy + topology + symmetric` is the full Λ -uniqueness chain. **It is not yet complete on main** (three PRs open, one residual honest sorry). **Therefore Λ stays Conjecture 1.** We will elevate Λ to Theorem 1 *only* when every Cauchy_ND sorry closes on `main` and Lake CI is green.

The proof route follows Aczél (1966, Thm 5.1) [1] and Cauchy (1821) [3]: the axis slice $f_i(t) = \Lambda(1, \dots, t, \dots, 1)$ is monotone (A1) with $f_i(1) = 1$ (A3); the log-space map $g_i(u) = \log f_i(e^u)$ is additive and monotone, hence linear, giving $f_i(t) = t^{\alpha_i}$; A5 forces $\alpha_i = \alpha_j$; A3 pins $\alpha = 1/k$; reassembly yields $\Lambda(x) = (\prod_i x_i)^{1/k}$.

1.3 VCG mechanism truthfulness (IN REVIEW, PR #172)

Both VCG obligations are closed on branch: `vcgDominantStrategyTruth` (truthful bidding is a dominant strategy) and `vcgIndividualRationality` (participation never yields negative utility), via Mathlib’s `Finset.exists_max_image` and `add_sum_erase`.

1.4 SLSA L2 achieved (ATTESTED)

Build-provenance posture upgraded to L1 + L2; all 5/5 flagship GHCR images (`alloy`, `sentra`, `amaru`, `killinchu`, `rosie`) empirically verified with `slsa-verifier`. SLSA L3 is *not* claimed — hardened/isolated builders remain roadmap.

1.5 Innovation Rounds 10–11 (IN REVIEW / IN FLIGHT)

Round 10 instilled frontier formalizations (all in review): Physics (#177; Noether, Liouville, Hamiltonian, entropy, A5-from-gauge), Quantum (#176; post-quantum signatures, Holevo bound [6], Kitaev, ZK, no-cloning $\rightarrow$ A5), CS (#178; Byzantine quorum $n \geq 3f + 1$, FLP impossibility [4], CAP), Crypto (#179; DSSE EUF-CMA, Rekor Merkle inclusion [8], Fulcio chain, BLS aggregation [2]), distributed systems (PR pending), Round 9 anatomy (#170). Round 11 (formula frontier) is in flight.

1.6 Sim-to-Real doctrine transfer — Walrus parallel (DESIGN + PARTIAL EMPIRICAL)

Modeled on the Walrus physical foundation model [9], we treat the locked doctrine kernel as a pretraining prior and a customer’s few-shot receipt set as fine-tuning data, and define the doctrine α -gap = |OOD acc. – in-distribution acc.|. On a live $N=60$ run against `sentra` and `alloy`:

Regime	Accuracy	α -gap
R0 control	1.00	—
R1 adversarial	0.50	0.50
R2 cross-jurisdictional	1.00	0.00
R3 multimodal	1.00	0.00
R4 temporal-drift	1.00	0.00
R5 low-data	1.00	0.00
Mean	—	0.10

Four of five unseen regimes transfer perfectly; adversarial transfers only partially (signature blocklist misses semantically novel attacks). We claim the architecture *admits* sim-to-real transfer — not that it matches physical-FM accuracy. This is a single $N=60$ run reported as partial empirical evidence, not a generalization guarantee.

2 Doctrine attestation (verbatim)

- Doctrine version: v11 LOCKED (v11.1 in flight, post-A5).
- Declarations 749 (pinned @ c7c0ba17); 794 post-A5 live.
- Unique axioms: 14 (unchanged by A5 — structure field).
- Sorries: 163 pinned (112 baseline + 51 Putnam); 191 post-A5 live.
- Λ status: **Conjecture 1 — NOT a theorem.**
- Supply chain: SLSA L1 + L2 attested; NOT L3.
- Section 889 vendors: Huawei, ZTE, Hytera, Hikvision, Dahua (exactly 5).

3 Honest posture

- Λ -aggregator uniqueness is Conjecture 1, conditional on the Cauchy_ND chain closing on `main`.
- A5 is a structure field, not a new axiom; axiom count remains 14.
- Reed–Solomon $\neq$ holographic. Event-sourcing $\neq$ time travel. Physics analogies are scaffolding.
- Quechua organ names are brand naming, not prior-art or cultural claims. No mystical claims.
- In-review PRs (#170, #172–#179) are labeled as such and not presented as landed theorems.
